PROFILE SUMMARY

MCA student and aspiring software engineer with hands-on experience building full-stack web applications. I have developed end-to-end projects featuring user authentication, relational databases, and containerized deployments using modern JavaScript ecosystems and cloud platforms. I am familiar with collaborative development workflows and focus on writing clean, maintainable code. I am currently seeking an entry-level role or internship where I can contribute to real-world projects and continue developing my technical skills.

EDUCATION

Master of Computer Applications (MCA)

Srusti Academy of Management & Technology

2025 – Expected 2027

Bachelor of Computer Applications (BCA)

Kalam Institute of Management Studies

2022 – 2025 | CGPA: 8.5 / 10

Intermediate (CHSE)

Vidwan Higher Secondary School

2022 | CGPA: 6.6 / 10

Matriculation

Saraswati Sishu Vidya Mandir

2020 | CGPA: 6.6 / 10

TECHNICAL SKILLS

Programming Languages: C, HTML, CSS, JavaScript, Python

Frameworks & Libraries: React, Next.js, Node.js, Express.js, Prisma, React Query

Database: PostgreSQL, MySQL, Supabase

Cloud, Tools & Platforms: Git, GitHub, Docker, Google Cloud Platform (Cloud Run), Vercel, Postman, VS Code, MS Office

Web & Development: REST APIs, JWT Authentication, Database Integration, Responsive Web Design, Figma, Framer

EXPERIENCE

ASSETMAGNETS — Software Engineer Intern

Node.js · Git · Docker · Google Cloud Run · Jest

- Configured foundational Node.js backend structures, including basic routing and middleware functions.
- Collaborated using Git and GitHub through branching, pull requests, and resolving merge conflicts.
- Worked with Docker to containerize applications and support standardized local development environments.
- Assisted in deploying containerized backend services to Google Cloud Run and configuring environment variables.
- Wrote basic automated tests using Jest and participated in debugging sessions to resolve runtime errors.

CERTIFICATIONS & TRAINING

Python Full Stack Development

QSpiders Bhubaneswar

Feb 2025 – Dec 2025

PROJECTS

DoseLoop — Family Health Companion

[React](#) · [Node.js](#) · [TypeScript](#) · [Express](#) · [PostgreSQL](#) · [Supabase](#) · [Prisma](#) · [Docker](#) · [Google Cloud Run](#)

- Built a full-stack application featuring a React single-page frontend communicating with a Node.js and Express REST API.
- Integrated Supabase Auth for secure user access and managed the application's relational data using PostgreSQL and Prisma.
- Containerized both frontend and backend services using multi-stage Docker builds, incorporating NGINX to serve static assets efficiently.
- Deployed the completed application to Google Cloud Run and configured secure environment variable management.

HarvestIQ — Tax Loss Harvesting Dashboard

[Next.js](#) · [React](#) · [TypeScript](#) · [Tailwind CSS](#) · [Framer Motion](#)

- Developed a financial dashboard frontend using Next.js and React to display calculated capital gains and simulated tax savings.
- Implemented client-side state management to handle bulk asset selections and recalculate dynamic data efficiently.
- Integrated mock REST APIs to handle asynchronous data loading, error states, and simulate a production user experience.

ExpenseSO — Personal Finance OS

[JavaScript](#) · [HTML](#) · [CSS](#) · [Chart.js](#) · [MySQL](#)

- Built a full-stack expense tracking application connecting a custom HTML/CSS and JavaScript frontend to a MySQL database.
- Integrated Chart.js to render interactive data visualizations representing user spending categories and financial trends.
- Designed backend queries and data structures to efficiently store, retrieve, and categorize expense records.

RESEARCH PUBLICATION

Title: Comparative Analysis of Prophet and LightGBM Models for Short-Term Electricity Load Forecasting

Authors: Chandan Mahapatra

Affiliation: Srusti Academy of Management and Technology, Bhubaneswar, India

Abstract: Accurate short-term electricity load forecasting is critical for grid stability. This study compares Prophet and LightGBM models for temporal feature extraction, demonstrating that LightGBM effectively captures non-linear demand patterns.

- Evaluated the performance of additive statistical models against gradient boosting for short-term electricity load forecasting.
- Applied Bayesian optimization techniques to tune model hyperparameters for improved accuracy.
- Utilized tabular feature extraction as an alternative to sequential time-series modeling.
- Demonstrated improved predictive accuracy using LightGBM to analyze non-linear demand fluctuations.
